

FULLSTACK DEVELOPMENT & SOFTWARE ENGINEERING

Results-driven Full-Stack Engineer with production experience delivering high-throughput, low-latency web applications using React 18+, Next.js 14, Node.js, and AWS. Proven expertise in concurrent rendering, server components, edge functions, micro-services, and RAG pipelines. Led a team of 50 freshers to successfully ship a production-grade Hiring Management System with real-time collaboration, AI resume screening, and 5K concurrent sessions. Consistently achieved 30-40% performance gains, sub-400ms API latency, and 95%+ CSAT through rigorous code quality, TDD, and scalable architecture practices.

Codebase Mastery & Fast Onboarding

Proven ability to dive into large, unfamiliar production codebases (monorepos, multi-team enterprise repos, legacy systems) and deliver value within days. Onboarded and shipped production features in under one week across 10+ company and open-source repositories by quickly mapping architecture, tracing data flows, and leveraging Git history, React DevTools Profiler, Node.js debugging, and Prisma/PostgreSQL query logs. Consistently selected to resolve critical blockers, debug complex issues, and refactor legacy components due to strong exploratory skills, pattern recognition, and clean-code discipline — making me the go-to developer for fast integration into any existing codebase.

TECHNICAL SKILLS

React 18 (Concurrent Mode, Transitions, useDeferredValue, Server Components) · Next.js 14 (App Router, Partial Prerendering, Turbopack, Route Handlers) · TanStack Query v5 (Infinite Queries, Optimistic Updates, Devtools) · TypeScript 5 (Discriminated Unions, Satisfies, Template Literal Types) · Node.js 20 (Worker Threads, Diagnostics Channel) · tRPC + Zod (End-to-end typesafety) · MongoDB (Aggregation Pipeline, Change Streams, Atlas Search) · Redis (Pub/Sub, Lua Scripts, Upstash Serverless) · Docker + Kubernetes (Helm, Kustomize) · AWS (EC2, RDS, Lambda@Edge, OpenSearch) · GraphQL Federation · Turborepo Monorepos · Playwright E2E · Sentry + OpenTelemetry

Clear Nexus

Nov 2024 - working

Worked as a Full Stack Developer

- Re-architected data layer using TanStack Query + React Server Components, reducing average TTI by 38% and cutting stale data incidents by 70% across 200K+ record dashboards.
- Implemented interruptible rendering with useTransition and useDeferredValue for complex filters and live previews, eliminating UI freezes during 50K-row virtualized tables.
- Introduced tRPC + Zod schema inference, removing runtime validation bugs and speeding up feature delivery by 22%.
- Established Turborepo pipeline with remote caching, dropping CI times from 18min to 4min.

Aerchain.io (Benguluru , India)

Sep 2023 - Oct 2024

Worked as a Full Stack Developer

- Accelerated data fetching by 35% using React TanStack Query with dependent queries and automatic caching, replacing manual fetch + useEffect patterns across 12 major features.
- Resolved critical re-rendering issue affecting 45% of the UI (15-second delays during large list updates) by introducing useDeferredValue and useTransition in React 18, combined with proper key management and virtualization – reducing load time to consistent 3.2 seconds.
- Implemented advanced memoization patterns using useCallback + useMemo in recursive tree components, preventing performance degradation when handling nested data structures with 250K+ records.
- Optimized PostgreSQL performance by designing composite and partial indexes on 7 high-cardinality tables (order_status + created_at, user_id + tenant_id etc.), cutting query execution time by 50% and reducing data redundancy by 22% through 3NF normalization.

Reserve Bank Innovation Hub (RBIH) (Benguluru , India)

Worked as a Full Stack Developer on Contract

- Designed and shipped a production Retrieval-Augmented Generation (RAG) chatbot that queries live customer data from MongoDB using vector embeddings (Pinecone/LangChain integration), delivering context-aware, personalised responses with 97% relevance score in UAT.
- Built full-stack application with React 18 (Concurrent Mode + useTransition for smooth streaming responses), Node.js + Express backend, and MongoDB Atlas with change streams for real-time data sync.
- Implemented multi-agent workflow orchestration using LangChain agents + tools (database lookup, approval routing, fallback LLM), reducing average resolution time from 12 mins (manual) to under 90 seconds.
- Automated CI/CD pipeline using GitHub Actions: lint → test (Jest + React Testing Library) → build → push ECR → deploy ECS, cutting deployment time from 45 mins to under 6 mins.

REAL WORLD PROJECTS

B2C E-commerce Management Software , with Admin panel(phone-1234567890 , password-1) (Next js,Shadcn,firebase , mongodb , next auth)

[Code](#) , [Live](#)

- Developed a custom e-commerce system for a hotel, including an admin panel for easy management of inventory, categories, and orders. Added features like item addition, deletion, category setup, and automated order confirmation emails to improve efficiency and customer satisfaction.

Backend Developer – Android Application (Node js , Express , mongodb , Middlewares , React Native , Expo)

[Code](#)

- Built RESTful APIs and implemented middleware for secure access, ensuring robust protection and smooth handling of high request volumes (100,000+ per second).
- Designed end-to-end logic for trek check-in/check-out using a single QR code across multiple checkpoints, including offline functionality for location-based tracking.
- Developed dynamic booking, user allocation, and accommodation management, enabling personalized booking views and smooth application flow.

OCR Text Extraction Application (Next js,Shadcn,mongodb , Textract js , next auth)

[Code](#) , [Live](#)

- Developed an OCR application that converts images into editable text using Textract.js. The application takes uploaded images, processes them to extract text accurately, and outputs it in a structured format, enhancing document processing efficiency and accessibility.

ACHIEVMENTS

Winner-National Level Hackathon (Citronics)

- Awarded first place at the Citronics hackathon for developing a complex online shop with advanced customization features. Designed a dynamic platform allowing users to personalize products, showcasing innovative problem-solving and technical skills in a competitive environment.
